THERMAL PROTECTIVE GLOVES

This pair of NOMEX III gloves, model 105 CB, is a Personal Protective Equipment (PPE), manufactured according to the health and safety standards specified in Appendix II of European Directive 89/686/EEC, transposed to Spanish Law through Royal Decree 1407/92, which complies with the requirements laid down in Standard EN 420 (general requirements), as well as with the requirements defined in points 5.1 (flame resistance), 5.2 (heat insulation through contact) and 5.3 (convective heat insulation), of Standard EN 407.

This PPE has been especially designed to be used as an inner glove to provide thermal protection, against the risks and levels indicated. It must always be used in combination with another external glove providing specific protection, such as electric-insulating gloves or gloves providing chemical protection, among others.

This product should never be used as an external glove or for other types of protection or different levels to those indicated in the pictogram at the bottom.

Gloves made using NOMEX III may be subject to a maximum of 10 washes, so as to not impair their physical properties, always respecting the indications provided in the attached pictogram:

- 1- Do not exceed 40°C in aqueous washing.
- 2- Do not use bleach or bleaching agents.
- 3- Suitable for ironing.
- 4- Suitable for dry cleaning using standard solvents.
- 5- Suitable for tumble drying.

Before you use a protective glove, especially after washing it, ensure you perform a thorough visual examination, in order to detect any degraded areas. If you have any doubt regarding the condition of a glove, make sure you dispose of it.

STORAGE

Gloves made of NOMEX III may be stored alike any other textile garments after their use, preferably in a dry and ventilated place, avoiding whenever possible exposure to direct sunlight.

This material does not suffer from foreseeable ageing when not used, therefore in normal storage conditions, its expiry cannot be calculated.
